

- Use (Flutter) instance + (iOS/Android)
- Use third-party libraries for unified experience

What is firebase & why to use

Firebase is a backend-as-a-service (BaaS) platform by Google, ready-to-use backend infrastructure for mobile and web apps.

Why use in React Native

- No Backend Required
- Quick Development
- Real-time features
- Comprehensive Service

Main Services by Firebase

Authentication: User sign-up, login session management (Email, Google, Facebook)

Cloud Firestore: NoSQL document database for storing and syncing data

Realtime Database: JSON-based database with real-time synchronization

cloud Storage: File storage for images, videos and documents

Cloud Functions: Serverless backend code
~~extension~~ execution

Cloud Messaging: Push notification

Analytics: Track user behaviour and app
usage

Crashlytics: Monitor and fix app crashes

Cloud Firestore

- Collections of documents (structured)
- Advanced queries with compound indexing
- Automatic scalability, better for large apps
- Robust offline support (caching)
- Best for New Projects, complex data structure

Realtime Database

- Single JSON tree (hierarchical)
- Limited, shallow indexing
- Requires manual sharding
- Basic offline support
- Simple real-time apps, legacy projects

initializeApp() function do?

- Establishes connection
- Authenticate App
- Return App Instance
- One-Time Setup
